

Statement from Rob Gourlay, Managing Director, Phi'on:

The science of structured water has been around for nearly 100 years. I have attached some published books on the science.

Structured water occurs in nature in pristine flowing streams and carries a negative charge. Structured water is not some creation in a laboratory, albeit I was the first scientist to create structured water from still water, and hold a permanent negative charge.

I have personally been involved in this science for over 30 years, and visited many of the top structured water scientists in the USA, Australia and UK.

I have conducted over 300 experiments with structured water. See my paper on agriculture. My other papers are at www.meawater.com.au

Of course there are people who have an opinion of the science of structured water, and most are crackpot skeptics, chemists and mainly public scientists who are captive of their peer review beliefs. These people have never undertaken research on structured water or undertaken experiments with structured water. These people never send me questions because they do not have a case to answer. They hide behind MSM.

It is unfortunate that you have removed the article. If MSM keeps sweeping new and relevant science under the carpet then you are squashing innovation in industry. I would have thought that MSM were more responsible and open to science innovations and capable of checking out the science with professional and experienced scientists in the area of science. You will find that some Noble prize winners have their name to structured water science.

If you want an independent view on the science, I suggest that you contact Prof. Pollack, Prof. Korotkov, and Dr Chaplin who are globally well known in the science of structured water and its benefits.
